COMPUTER ENGINEERING

Ho Chi Minh City, November 2023

LAB 3.1 Login Form Validation

Go back to LAB 2.3, apply validation for your login form.

First, describe all requirements for the input data. Then apply:

- **Client side validation:** HTML + Javascript
- **Server side validation:** PHP

Choose appropriate way to send notification to user for re-login, make sure you **don't ask the user to *re-type all data***

I. Requirement

Login form input data requirements:

- Must be valid email form ([a@b.c](#))
- The email must exist in the database
- Valid password: from 6 characters forward
- Correct password

II. Implement

1.Valid email

Using Bootstrap form to check

USER: GUEST --- LEVEL: #NA

LAB Home Products Login Register

Login

Email address

a.c

Password

•

Please include an '@' in the email address. 'a.c' is missing an '@'.

Login

2. Check email exist

Check email exist in database or not, then notify if email is not exist

USER: GUEST --- LEVEL: #NA

LAB Home Products Login Register

Login

Email does not exist!

Email address

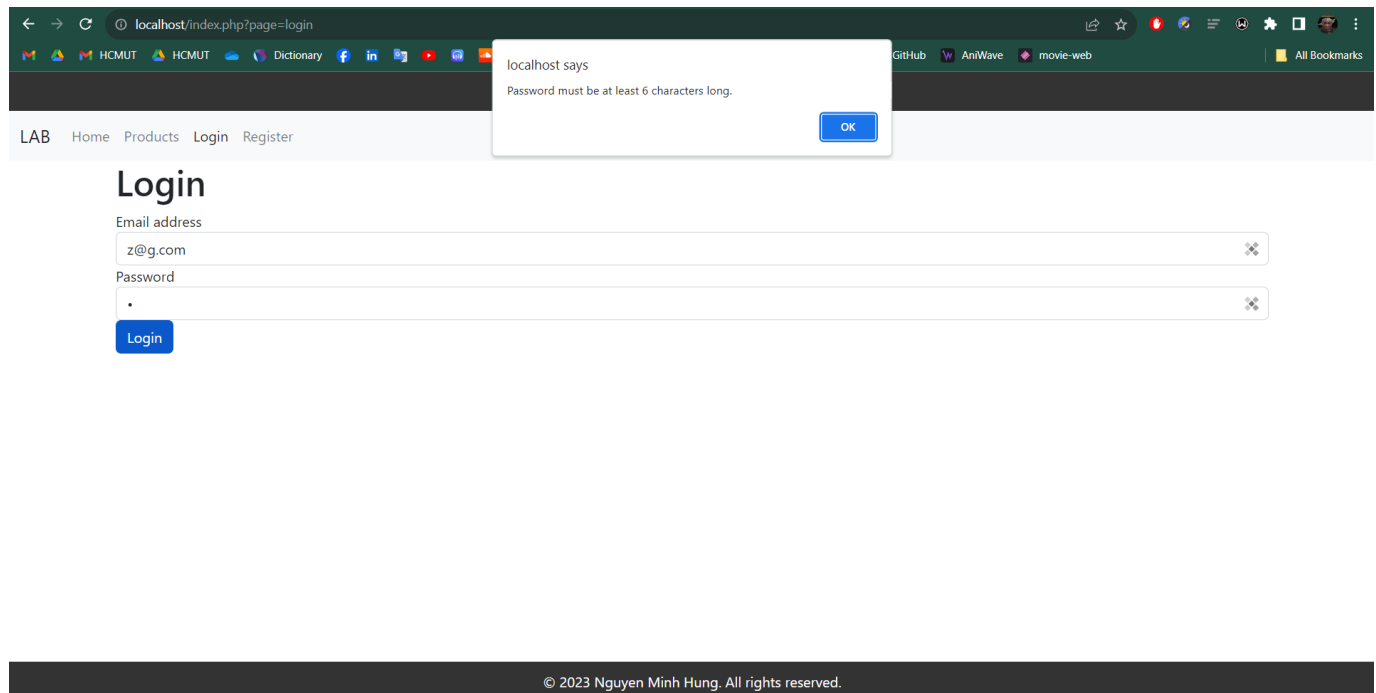

a@cc.c

Password

Password

Login

3.Valid password

4. Check correct password

Check if the password is correct with the registered email

In all case, the user doesn't need to re-type all the data, so it fit the requirement.
